

Raingarden

What is this Project?

Master Water Stewards Dave and Katharine installed this raingarden, which contains native plants that will capture rainwater and pollutants, as well as they redirected downspouts so they are running into the raingarden and into catch basins.

Why Install a Raingarden?

This project will reduce the water that runs off a portion of this property and neighboring properties, preventing that water from going straight into stormdrains. It will also capture water that normally ends up too close to the foundation of this property. Reducing the runoff helps keep our lakes and rivers clean! Everyone plays a part!

Project Details:

- ◆ **120 sq ft raingarden**
- ◆ **Captures a total of 323 gallons of water for every inch of rain!**
